

# RICO Goals

- Precipitation effects on droplet probes  
*No natural cloud droplets in RICO rain shaft*

- Small Scale Droplet Clustering

*Is it real? Quantifiable? Important?*

(Collaborators: Patrick Chuang and Jennifer Small - PDI  
Jean-Louis Brenguier and Frederic Burnet - FSSP)

- Entrainment, Mixing and Droplet Growth

*Comparing observations with Modeling results*

(Collaborators: Steven Krueger, Graham Feingold, Hermann Gerber)

- Mystery Echoes

*SCMS X-band Bragg or Rayleigh?*

(Collaborator: Charles Knight)

# Drop splashing on FSSP

- FSSP LWC well correlated with 2D-C and 2D-P probes.
- 2D-S data shows there are no natural cloud droplets in a RICO rain shaft.

### Spurious FSSP LWC versus 2D LWC

14:48:15.265.286.430 to 14:48:15.369.188.317

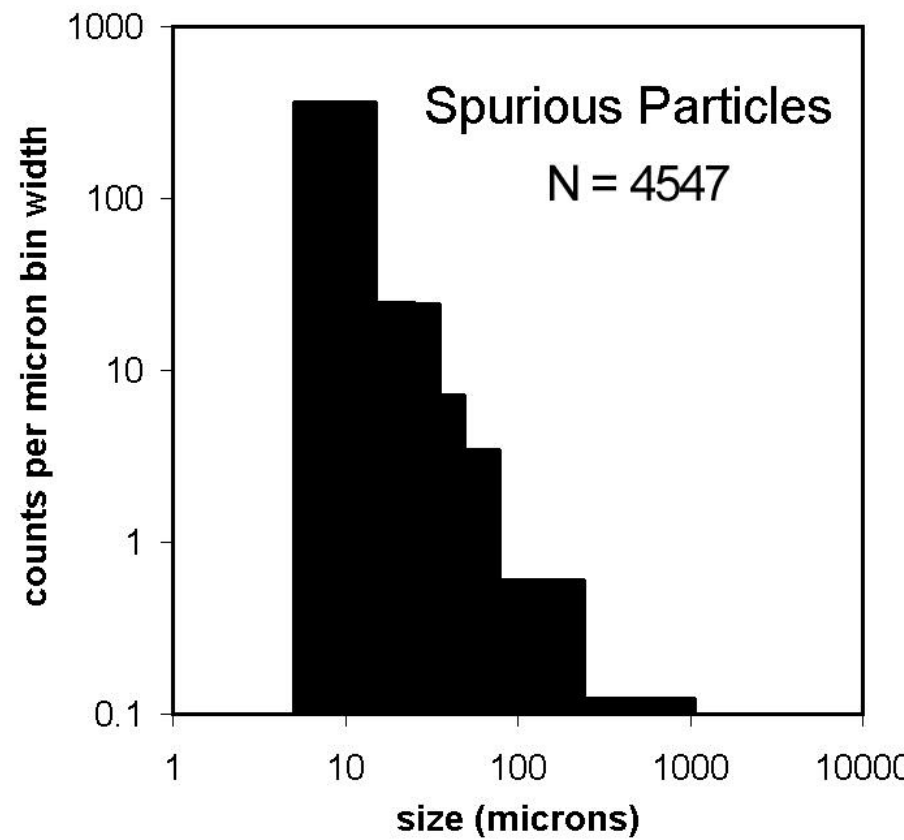

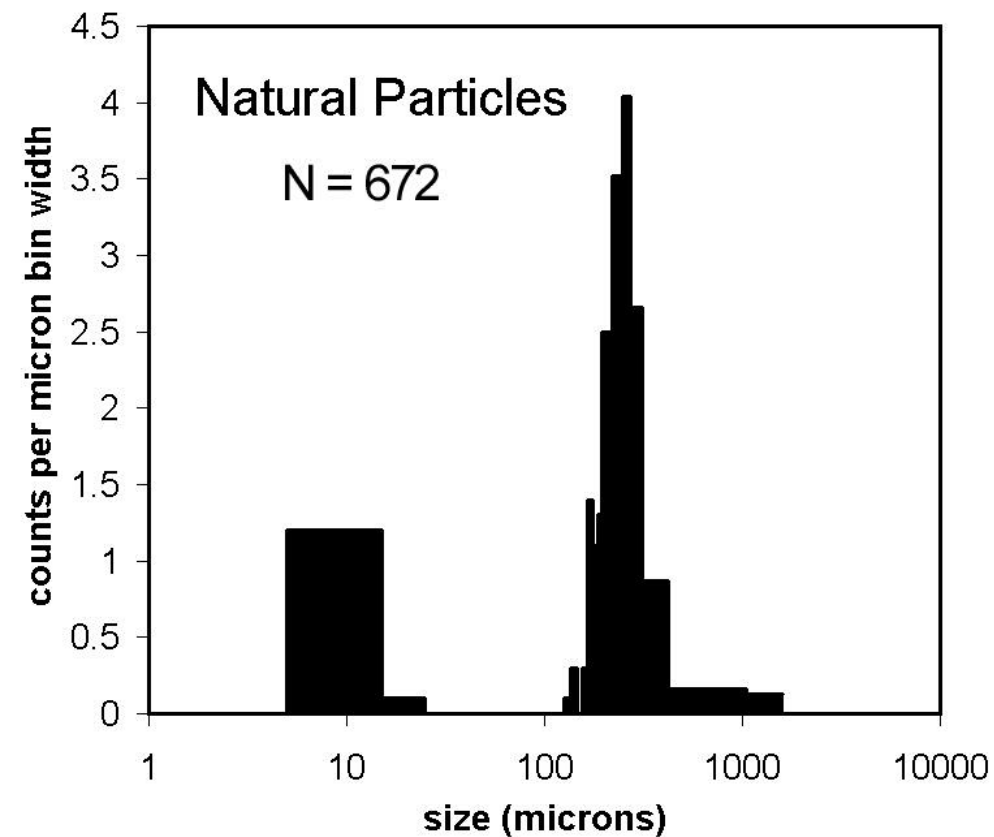

14:48:15.369.188.317 to 14:48:15.501.921.618

14:48:15:501.921.618 to 14:48:15.592.925.486

14:48:15:592.925.486 to 14:48:15:757.435.109

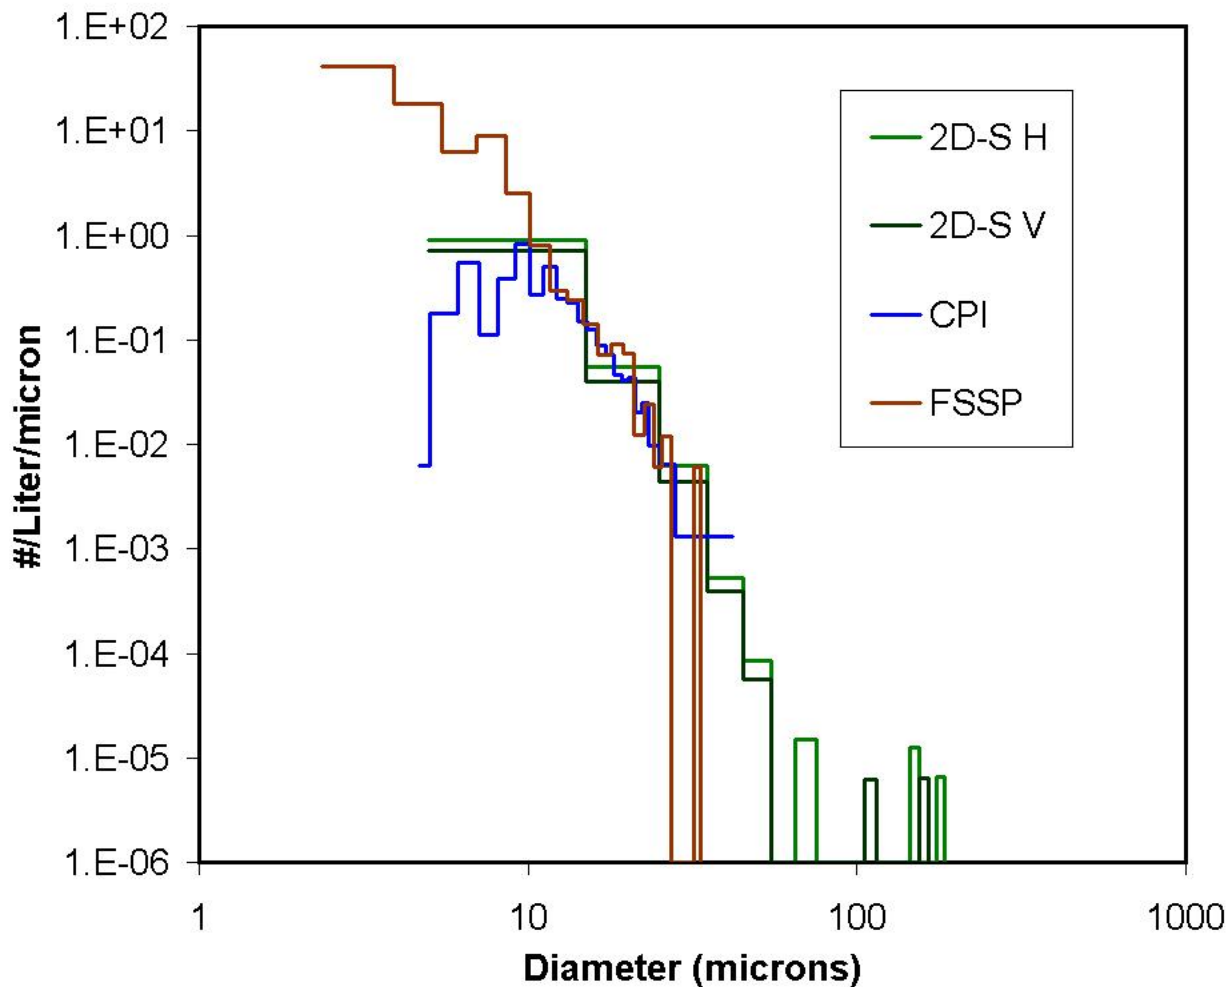

14:48:15.757.435.109 to 14:48:15.822.386.807

14:48:15.833.386.807 to 14:48:15:960.111.618

# Ultra Giant Nuclei Measurements

- The 2D-S may prove useful for measuring UGN concentrations.
- 2D-S appears to detect 10 micron droplets
- 2D-S detects a few very large deliquesced drops.

- FSSP, CPI, and 2D-S particle size distributions averaged over the big circle flown at 1000 feet from 12:09:30 to 12:44:30 on 1-23-2005.
